HEALTH: CANCER DIAGNOSES. DR. GEORGE HOLLENBERG, board-certified pathologist and founding director of ACUPATH LABORATORIES, INC.: "When it comes to cancer, the more information that can be determined during the initial diagnosis, the easier it is to create an individualized follow-up plan for each patient. Now, thanks to advances in the area of testing called cytogenetics, cancer diagnoses are being delivered with much more data than ever before, which could spell the end of the one-size-fits-all diagnosis for cancer patients. Cutting-edge tests can determine not only the type of cancer present, but also whether or not the patient has one or more genetic abnormalities that could affect the success of treatment or the chance of recurrence."
